**Laboratory Notebook, Cat. 1170**

This notebook covers the period November 1873-December 1877. Most of the laboratory notes and drawings are by Charles Batchelor; a few are by Edison. The material relates primarily to batteries, induction coils, and telegraphy. There is also a list of basic scientific questions, ranging from Newton's law of gravitation to atomic theory. The book also contains numerous accounts and lists of prices, stock, and hours worked. The flyleaf is labeled "Experimental Researches." The book contains 74 numbered pages, followed by 11 unnumbered leaves. Some leaves have been torn out.

Blank pages not filmed: 18-19, 24-25, 34-49, 52-53, 56-57, 60-69, 72-73.

Missing pages: 27-28.

1874 May 9.
I found that when I put bichromate crystals into the porous & then poured water & sulphuric acid on top & adding sulphuric acid the battery seemed a great deal stronger.

1875
April 10th
Ordinary Electroposition in porous cup Tubular outside with Iron outside & Cadmium inside makes a Good battery

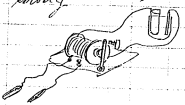
# Induction Coils experiments

1874

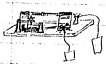
Apl 18. Wound spool for single current & to be made
1 & hold glass tube of Iron wire. Got shock but not very strong. Use of such relay spool

2 Wound 3 layers sounder wire next to core & fine Iron wire over it & fill it very good shock from Carbon battery

3 Made Coil longer & put 4 layers sounder wire on & filled up with fine Iron wire spool being about 5" long. & weighing about 1 lb.
Made battery out of an old glass jar & put a piece of sheet zinc & small piece of Carbon
The induction from this arrangement was very strong.



Apl 26 Made Coil like following:



11 layers of Register wire & then filled up with 35 Iron wire & then boiled in paraffine for about ½ hour.
Boiling in Paraffine almost double the strength — Core made of pieces of iron wire instead of solid is much better. Glass there ought to be lots of surface on the handles. Small Carbon battery & Coil works first rate.

Bad 2:
1 Domestic Bell
1 " Recorder
1 Bain Printing Relay
8 Rolls Bain paper
